

Azure VMware Solution | Multi-region active/passive DR

TARGET DESIGN | Gen 1 | Two independent private clouds | Region pair and recovery product TBD

Asynchronous regional DR, not stretched vSAN. DR RPO/RTO and recovery product remain TBD.

Approved failover: fence primary, recover VMs, then change DNS/routes. Backups remain separate.

Enterprise landing zone | Platform + AVS application

HIGH-LEVEL ENTERPRISE VIEW | Same active/passive AVS as page 1 | Target controls, not deployment

Platform services integrate with AVS; detailed hybrid connectivity and recovery remain on page 1.

Global Reach bypasses hub firewalls. Guest protection and backup implementation require validated products.

Regional DR | normal protection, failover and return

Explanation of page 1 | Region B is provisioned, but protected workloads become active only through approved recovery

REGIONAL DR IS DIFFERENT FROM ZONE HA

The diagram contains two regional failure domains and two independent private clouds. Local host HA remains, but there is no cross-region vSAN mirror, shared vCenter or zero-interruption promise. Replication and historical backup solve different failures. A recoverable secondary needs adequate preprovisioned compute, storage and supporting services, not just VM copies. Normal replication is A to B; any reversal is a deliberate reprotection step. Product-specific recovery procedures and workload-specific objectives remain open design decisions.

CONNECTIVITY AND RECOVERY ASSUMPTIONS

Blue lines show private connectivity, including the direct regional Global Reach transport. The purple dashed arrow shows a logical replication relationship, not a second physical network. Regional hub gateways do not forward between ExpressRoute circuits. Failing over applications requires approved network mappings, DNS/routes, identity and security policies; none is automatically solved by a replication arrow. Regions, host SKU, final capacity, recovery product and DR RPO/RTO are TBD. Backup VM hosting, private endpoints and Blob repositories remain implementation proposals.
